The Product Management for AI & Data Science Course
AI Coder: Complete Claude Code & Coding Agents Course
Claude Code: Building Faster with AI, from Prototype to Prod
Designing Gamification Level2 (Intermediate) + Certification
100 Days of Code™: The Complete Python Pro Bootcamp

Tomasz Czarnecki

Building AI Products with Ownership | Agentic Workflows & Systems Thinking | Ex-Heineken AI Hub (€3.2B)

China

Summary

I own and ship AI products end-to-end — from strategy and roadmap through to working interfaces and agentic workflows that real teams use. • At Heineken's Global Analytics & AI Hub, I was the founding product lead for the human layer of production AI/ML systems that influenced €3.2B in annual commercial spend. I defined product direction, prioritized features with Data Science and Commercial stakeholders, and shipped three AI systems (Allocation AI, Promo Advisor in 17 markets, and Smart Flighting). • Turned probabilistic model outputs into explainable, actionable tools that non-technical teams trusted — cutting promo planning time 30–40% and shifting decisions from intuition to data-driven. • Built the shared React/MUI component library alongside engineering and acted as the bridge between technical possibility and business outcomes. • Spent a decade building non-deterministic generative systems — genetic algorithms and large-scale parametric optimization at MAD Architects and AREP. The same mental model of handling uncertainty and competing constraints now applies directly to LLM agents and agentic workflows. • Currently building Zoja.ai — developing AI personas and multi-agent systems with Claude Code, Python, and modern agent tooling while strengthening my engineering capability in this space. • Polish native, English C2, Mandarin B2. Ten years living and working in China, returning to Poland in August. Looking for roles where one person can own a strategic product area in a fast-moving AI space — with real autonomy and the freedom to keep building on the side.

Experience

Zoja.ai
Independent AI Engineer
May 2026 - Present (2 months)
China

- Building strong engineering foundations in agentic systems and LLM workflows with a focus on methodology, structure, and production-quality code.
- Progressing from hands-on work with Claude Code toward proper agent orchestration (LangGraph and similar frameworks) to design reliable multi-agent systems.
- Developing the technical capability to eventually ship Zoja.ai — a bicultural AI persona platform — as a high-quality, long-term personal project.

The HEINEKEN Company

Founding AI Product Lead (Global Analytics & AI Hub)

March 2021 - May 2026 (5 years 3 months)

Amsterdam, Netherlands

Startup-like product incubator inside Heineken delivering custom AI/ML systems and decision tools to Operating Companies globally. The hub built production AI products managing €3.2B in annual commercial spend.

- Founding product lead for the human layer of production AI/ML systems that influenced €3.2B in annual global spend. Owned product direction from discovery through shipped features.
- Led end-to-end product discovery for the three core AI systems (Allocation AI, Promo Advisor in 17 markets, and Smart Flighting). Facilitated cross-functional sessions with product managers, data scientists, engineers, and global stakeholders to define what the products should actually do and translate ambiguous needs into clear product scope and priorities.
- Defined and drove the product strategy and roadmap for the three AI systems, working directly with Data Science, Engineering, and Commercial stakeholders to align technical possibilities with business outcomes.
- Acted as the main bridge between technical model behavior and commercial needs — translated probabilistic outputs into prioritized, actionable product decisions that teams actually used.
- Designed and shipped interfaces that turned model uncertainty into explainable, simulatable tools, cutting promo planning time 30–40% and increasing trust in AI-driven recommendations.

- Built and maintained the shared React/MUI component library and design system used across all analytical products in the hub, working closely with engineering on implementation and iteration.

Macopedia

Product Designer

January 2020 - March 2021 (1 year 3 months)

Poznań

- Delivered end-to-end product work on complex enterprise platforms (TYPO3, Magento) — from discovery and UX through to production-ready front-end implementation.
- Designed and built reusable component libraries that accelerated delivery across multiple client projects (including Pearson, Macmillan Education, and Raben), improving consistency and development speed.
- Worked hands-on with full-stack engineering teams to turn designs into production-grade interfaces, gaining direct experience bridging design decisions with technical constraints and implementation realities.

7 International

Project Lead & Business Developer - China

May 2017 - December 2019 (2 years 8 months)

Guizhou, China

- Led projects end-to-end between Poland and China: gathered requirements and developed initial concepts with clients in China, then managed the design work with the Polish team and aligned outputs with the Chinese engineering team.
- Coordinated between the Polish design team and Chinese engineering team — reviewed progress, gave feedback and design direction, resolved issues, and kept projects moving across time zones.
- Won new projects directly from Chinese clients (~70M RMB total) through site visits, meetings, and negotiations, while overseeing delivery from concept stage through to engineering coordination.
- Built and led a 12-person team across both locations while setting up the company's first European office.

AREP

Lead Algorithmic Designer

June 2016 - May 2017 (1 year)

Beijing City, China (On-site)

- Developed generative and optimization systems using genetic algorithms and evolutionary solvers (Grasshopper, Rhino, C#) to optimize a 21 million m² urban masterplan against competing constraints including wind flow, structure, and cost.
- Built reusable computational libraries that automated complex 3D modeling workflows across multiple large-scale projects, significantly reducing manual work and improving consistency.
- Worked on non-deterministic, constraint-driven systems — an early form of the same optimization and orchestration logic now used in agentic AI workflows and multi-agent systems.

MAD Architects

Algorithmic Designer

February 2015 - June 2016 (1 year 5 months)

Beijing City, China (On-site)

- Built genetic-algorithm-driven generative systems to optimize building geometry under multiple competing constraints (aesthetics, structure, and cost).
- Created reusable computational infrastructure that was adopted across multiple concurrent international projects, including the Harbin Opera House and Xinhee Design Center.
- Worked as an internal tools builder — developed the algorithmic systems and workflows that other design teams ran on, accelerating iteration speed across the studio.

7 International

Architect & Business Developer

January 2014 - February 2015 (1 year 2 months)

Guizhou, China

- Embedded in the Chinese HQ to learn workflows, team dynamics, and design culture; returned to Poland to establish the company's first European office (legal registration, workspace, setup, early onboarding).
- Acted as the primary cultural/operational bridge between Chinese leadership and the emerging Polish team.

Budnex

Construction Engineer

September 2013 - January 2014 (5 months)

Gorzów Wielkopolski, Poland (On-site)

Kaja Interieurs
Interior Design Intern
November 2012 - May 2013 (7 months)
Netherlands (Hybrid)

Education

Istanbul Technical University
International Exchange (2 semesters), Architecture · (2011 - 2012)

Poznan University of Technology
Ph.D. (unfinished) , Building and Environment · (2014 - 2015)

Poznan University of Technology
M.Sc., Architecture and Urban Planning · (2010 - 2014)

Poznan University of Technology
B.Eng. , Architecture and Urban Planning · (2007 - 2010)

Poznan University of Technology
B.Eng. (2 semesters), Computer Science · (2006 - 2007)
